Computing Assignment 2

Angela Huynh

September 20, 2016

- 1. Working with data: In the datasets folder on the course GitHub repo, you will find a file called cancer.csv, which is a dataset in comma-separated values (csv) format. This is a large cancer incidence dataset that summarizes the incidence of different cancers for various subgroups.
- i) Load the data set into R and make it a data frame called cancer.df

ii) Determine the number of rows and columns in the data frame.

```
nrow(cancer.df) #number of rows
```

[1] 42120

```
ncol(cancer.df) #number of columns
```

[1] 8

iii) Extract the names of the columns in cancer.df.

```
colnames(cancer.df)
```

iv) Report the value of the 3000th row in column 6.

```
cancer.df[3000,6]
```

[1] 350.69

v) Report the contents of the 172nd row.

```
cancer.df [172,]
```

```
## year site state sex race mortality
## 172 1999 Brain and Other Nervous System nevada Male Black 0
## incidence population
## 172 0 73172
```

vi) Create a new column that is the incidence rate (per 100,000) for each row.

cancer.df\$incidencerate <- cancer.df\$incidence/100000</pre>

vii) How many subgroups (rows) have a zero incidence rate?

```
length(which(cancer.df$incidencerate==0))
```

[1] 23191

viii) Find the subgroup with the highest incidence rate.

```
which.max(cancer.df$incidencerate)
```

[1] 21387

- 2. Data types
- i) Create the following vector: $\mathbf{x} \leftarrow \mathbf{c}("5","12","7")$. Which of the following commands will produce an error message? For each command, Either explain why they should be errors, or explain the non-erroneous result.

```
x <- c("5","12","7")
max(x) #max is listed as "7"
```

[1] "7"

sort(x) #sorts as "12" "5" "7" because the function looks at the first character in the string

```
## [1] "12" "5" "7"
```

#sum(x) #produces an error because these are not numeric types, thus they cannot be summed

ii) For the next two commands, either explain their results, or why they should produce errors.

```
y <- c("5",7,12)
y #output is the same as x
```

```
## [1] "5" "7" "12"
```

```
#y[2] + y[3] #cannot add strings together
```

iii) For the next two commands, either explain their results, or why they should produce errors.

```
z <- data.frame(z1="5",z2=7,z3=12)
z
```

```
## z1 z2 z3
## 1 5 7 12
```

```
z[1,2] + z[1,3] #adds 7 and 12 together, getting 19. Integers are able to be added.
## [1] 19
  3. Data structures: Give R expressions that return the following matrices and vectors (i.e. do not construct
     them manually).
  i) (1, 2, 3, 4, 5, 6, 7, 8, 7, 6, 5, 4, 3, 2, 1)
seq1 \leftarrow seq(from=1, to=8, by=1)
seq2 \leftarrow seq(from=7, to=1, by=-1)
c(seq1,seq2)
## [1] 1 2 3 4 5 6 7 8 7 6 5 4 3 2 1
  ii) (1, 2, 2, 3, 3, 3, 4, 4, 4, 4, 5, 5, 5, 5, 5)
c <- vector()</pre>
for (i in (1:5)){
  c <- append(c, rep(i,i))</pre>
}
С
## [1] 1 2 2 3 3 3 4 4 4 4 5 5 5 5 5
 iii) (0 1 11 0 11 1 0)
a <- matrix(rep(1,9),3,3)
^diag<-^(a,0)
##
         [,1] [,2] [,3]
## [1,]
            0
                 1
## [2,]
            1
                  0
                       1
## [3,]
           1
                  1
                       0
               9
                     16
      1
          8
               27
                     64
                    256
          16
             81
          32 243
                  1024 \, \mu
(b <- matrix(c(seq(1,4),seq(1,4)^2,seq(1,4)^3,seq(1,4)^4,seq(1,4)^5), nrow=5, ncol=4, byrow=TRUE))
         [,1] [,2] [,3] [,4]
## [1,]
                  2
            1
                       3
## [2,]
            1
                  4
                       9
                            16
## [3,]
                 8
                      27
                            64
            1
## [4,]
            1
                16
                      81
                          256
                32 243 1024
## [5,]
            1
```

4.Basic Programming

i) Let $h(x,n) = 1 + x + x^2 + \ldots + x^n = \sum_{i=0}^n x^i$. Write an R program to calculate h(x,n) using a for loop.

```
hx <- function(x,n){
  valuei <- 0
  sumx <- 0
  for (i in(0:n)){
    sumx <- sumx + x^(i)
    valuei <- valuei + 1
  }
  return(sumx)
}</pre>
```

- ii) If we list all the natural numbers below 10 that are multiples of 3 or 5, we get 3, 5, 6 and 9. The sum of these multiples is 23. Write an R program to perform the following calculations.
- a) Find the sum of all the multiples of 3 or 5 below 1,000.

```
multiple35 <- 0
count <- 0
for (i in(1:999)){
   if (i%%3==0 | i%%5==0){
      count <- count + i
      multiple35 <- multiple35 + i
   }
}
multiple35</pre>
```

[1] 233168

b) Find the sum of all the multiples of 4 or 7 below 1,000,000.

```
multiple47 <- 0
count1 <- 0
for (i in(1:999999)){
   if (i%%4==0 | i%%7==0){
      count1 <- count1 + i
      multiple47 <- multiple47 + i
   }
}
multiple47</pre>
```

[1] 178571071431

iii) Each new term in the Fibonacci sequence is generated by adding the previous two terms. By starting with 1 and 2, the first 10 terms will be (1,2,3,5,8,13,21,34,55,89). Write an R program to calculate the sum of the first 15 even-valued terms.

```
countevens <- 1
sumevenfibs <-2
fibterms <- vector()</pre>
evenfib <- vector()</pre>
fibterms[1] <- 1
fibterms[2] \leftarrow 2
evenfib[1] \leftarrow 2
for (i in(3:100)){
  fibterms[i] <- fibterms[i-1] + fibterms[i-2]</pre>
  if (fibterms[i]%%2==0){
    evenfib <- append(evenfib, fibterms[i])</pre>
    sumevenfibs <- sumevenfibs + fibterms[i]</pre>
    countevens <- countevens + 1</pre>
    if (countevens >= 15){
      break
    }
 }
}
sumevenfibs
```
